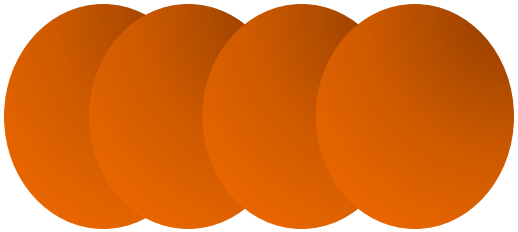
Corverc 2011	7	Various	42%
Bertz 2015	9	Various	100%



Analysis of cases managed by DAIR

(regardless of the appropriateness of the indication)

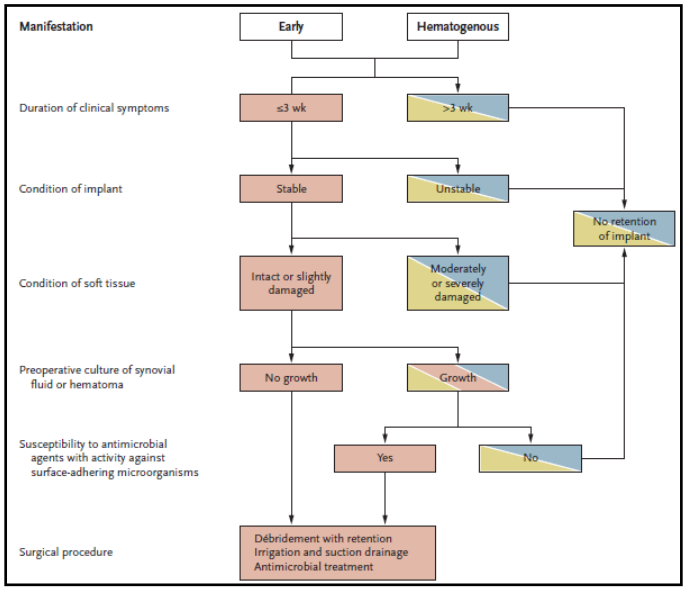
Clinical management of PJI at Spanish hospitals

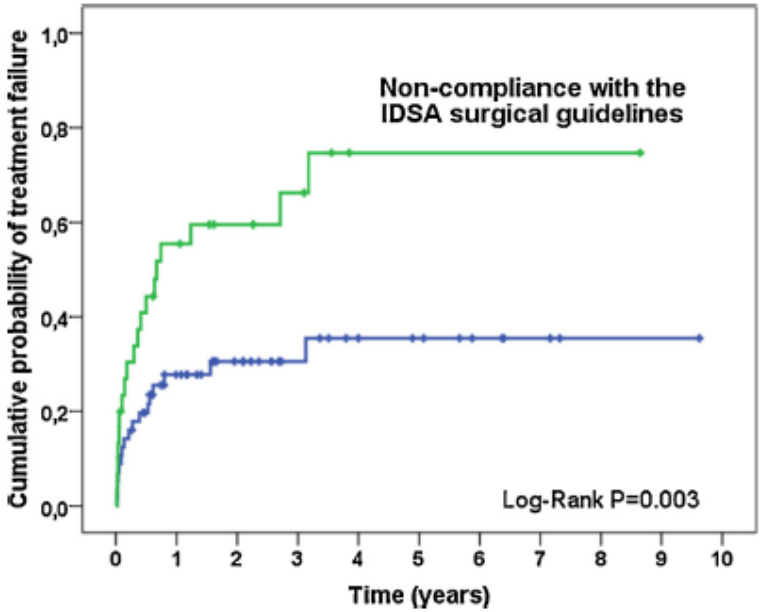
- multi-disciplinar medical teams (orthopedists, IDs, micro, radiologists…)
- Zimmerli's criteria for DAIR
- treatment standards
  - rifampin-based combinations for staphylococci
  - β-lactamas (±rifampin) for streptococci

Streptococcal & Staphylococcal PJI – foreword on methods

Re. criteria for DAIR

- good condition of skin and soft tissues
- soundly fixed prosthesis (surgical criteria)
- young biofilm / acute infection
  - short duration of symptoms (≤21 days)
  - hematogenous or early post-surgical PJI





89 PJI caused by MSSA

Zimmerli, 2004. NEJM

Bouaziz, 2017. Med Mal Infect

Streptococcal & Staphylococcal PJI – foreword on methods

Duration of symptoms

- the sooner, the better… but, when is it too late???

Table 1.—Study Population

Characteristic	Rifampin Combination (n=18)	Placebo Combination (n=15)
Mean (SD) age, y	66 (15)	67 (15)

Streptococcal & Staphylococcal PJI – foreword on methods

Cure = cure of the infection at 1st try while retaining a functional prosthesis

Primary endpoint → Failure (broad definition)

- Death related with the infection (clinical criteria)
- Clinical signs of infection persistence/relapse at last visit → due to staph/strepto and/or **other microorganisms**
- Need for salvage therapy, including
  - need for extra debridements > 30 days after the 1st one
  - need for extra couses of ATB beyond the first plan
    - including suppressive antimicrobial therapy

  → due to staph/strepto and/or **other microorganisms**
  - need for prosthesis removal
    - for any reason (including orthopaedics) during the 1st year
    - due to persistent/relapsing infection at any time → due to staph/strepto and/or **other microorganisms**

REVIEW 10.1111/1469-0691.12003

Antimicrobial treatment concepts for orthopaedic device-related infection

P. Sendi[1,2,3] and W. Zimmerli[1]

Start and dosage of rifampin therapy

No study has investigated the optimal time for starting rifampin therapy in patients with staphylococcal ODRI. Concerns regarding liver toxicity or drug interactions with compounds

become clinically relevant after several days [18]. However, it is prudent not to use rifampin in the early course of infection, for the following reasons. First, perioperative rifampin therapy increases the risk of superinfection with rifampin-resistant staphylococci by selection pressure on the local flora [19]. Second, emergence of resistance is highest when the bacterial load is high [7]. Thus, there are arguments for

Short Communication

Short- versus long-duration levofloxacin plus rifampicin for acute staphylococcal prosthetic joint infection managed with implant retention: a randomised clinical trial ☆

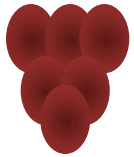
Jaime Lora-Tamayo [1,*], Gorane Euba [2], Javier Cobo [3], Juan Pablo Horcajada [4], Alex Soriano [5], Enrique Sandoval [6], Carles Pigrau [7], Natividad Benito [8], Luis Falgueras [9], Julián Palomino [10], María Dolores del Toro [11], Alfredo Jover-Sáenz [12], José Antonio Iribarren [13], Mar Sánchez-Somolinos [14], Antonio Ramos [15], Marta Fernández-Sampedro [16], Melchor Riera [17], Josu Mirena Baraia-Etxaburu [18], Javier Ariza [2], Prosthetic Joint Infection Group of the Spanish Network for Research in Infectious Diseases—REIPI

Int J Antimicrob Agents. 2016; 48: 310-6

- **Design** – open, comparative, randomized clinical trial

- **Setting** – 17 Spanish hospitals (REIPI), from 2009 to 2013

Staphylococcal PJI managed by DAIR



Eligible Patient
- Acute staphylococcal infection
- Debridement + Implant Retention

Hypothesis of non-inferiority

Main goal: cure rate

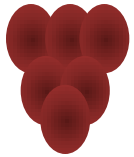
Short schedule = 8 weeks
Both knee & hip prosthesis

Rifampin 600 mg/d
Levofloxacin 750 mg/d

Standard schedule
- Hip prosthesis = 3 months
- Knee prosthesis = 6 months

$\Delta = 15\%$; $\alpha=0.05$; $1-\beta = 0.80$; loss rate = 10% → 195 patients

Staphylococcal PJI managed by DAIR



172 patients with acute staphylococcal PJI

Exclusion criteria

112 excluded
- 48 (28%) resistance to LVX or RIF
- 19 (11%) other treat. > 7 days
- 17 (10%) prosthesis removal
- 12 (7%) debridement delay > 21d
- 16 (9%) other

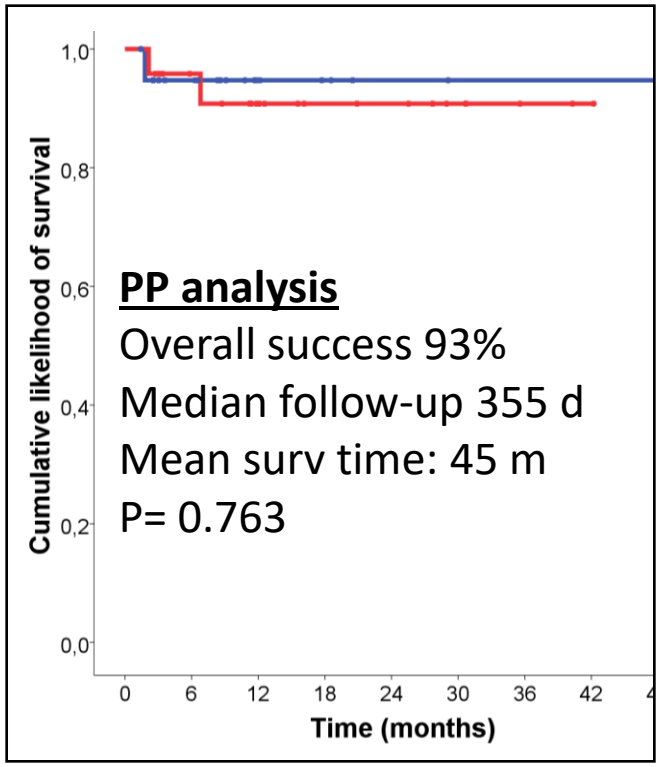
63 (35%) randomized
Intention-to-treat
- 33 long arm
- 30 short arm

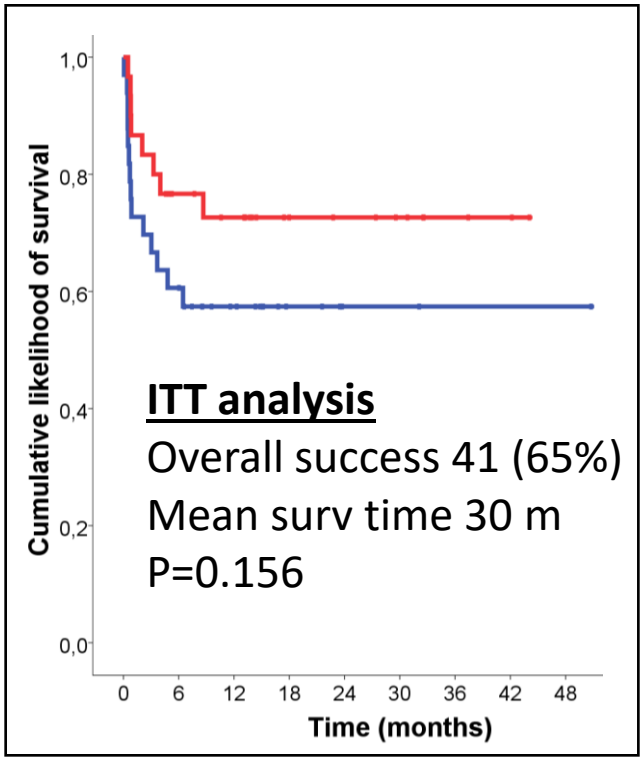
19 non-evaluable (13 in the long arm)
- 10 (53%) toxicity to ATB
- 2 (11%) early prosth. Removal
- 5 (26%) lost of follow-up
- 2 (11%) protocol violation

44 patients for PP analysis
- 20 long arm
- 22 short arm

Aim 2 – Efficacy of a short schedule of levofloxacin + rifampin

	Long arm (n=33)	Short arm (n=30)	*p*
Polymicrobial infection	9 (27%)	2 (7%)	**0.046**





Short arm

Long arm

- 52 hospitals (15 nations)
- 2003-2012
- PJI caused by streptococci
  - No superinfections
  - Polymicrobial cases allowed

Streptococcal PJI managed by DAIR

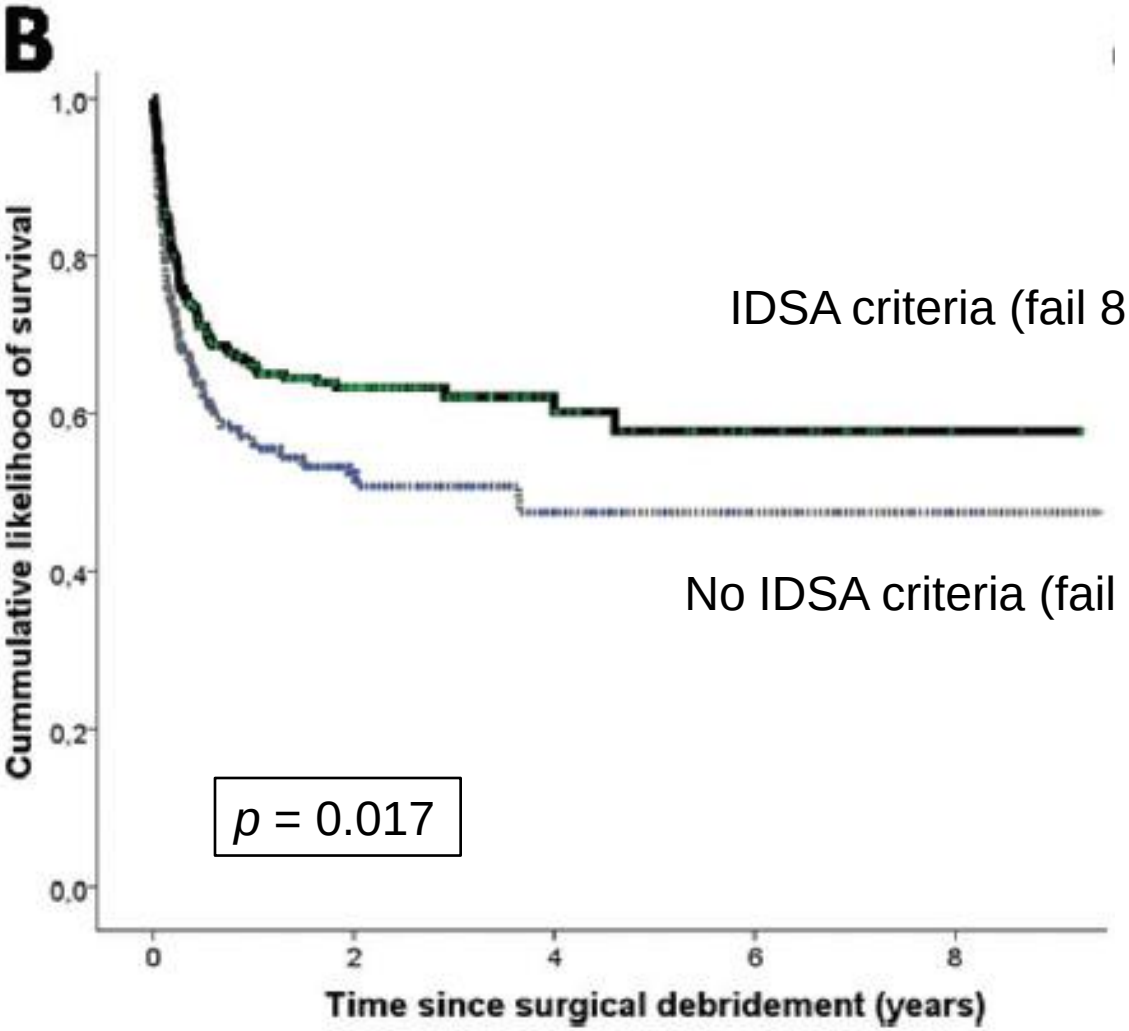
"… the not-so-good prognosis…"

Failure observed in 187 patients (42.1% [CI95% 38 - 47%])

- 147 (79%) due to streptococcal persistence
- 25 (13%) due to other microorganisms (superinf)
- 15 (8%) orthopaedic causes

Streptococcal PJI managed by DAIR



IDSA criteria (fail 81/221 = 37%)

No IDSA criteria (fail 116/223 = 52%)

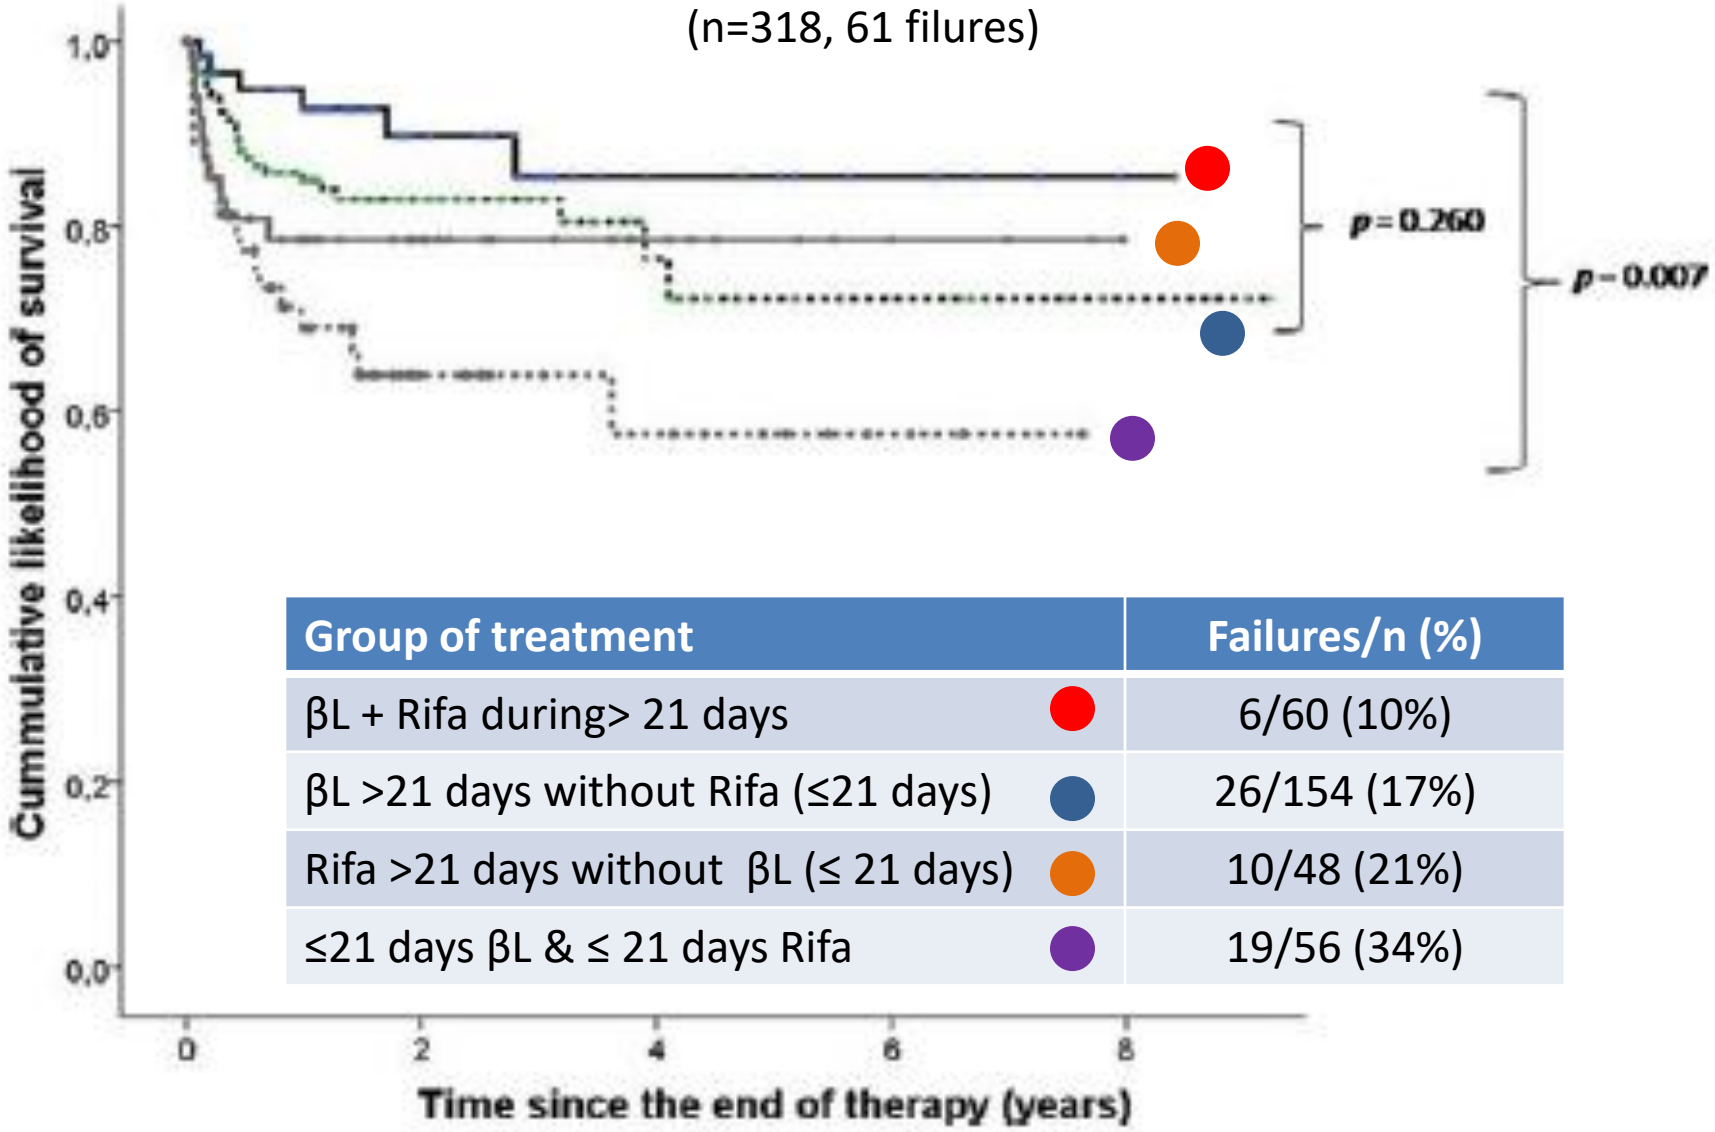
Failure rate according to prosthesis age (post-operative cases)

	Adjusted Hazard Ratio	
	All patients (n=444, fail 187)	**Cases not failing within the first 30 d. (n=389, fail = 132)**
Renal chronic failure	1.55 (0.97 – 2.48)	-
Rheumatoid arthritis	**2.36 (1.50 – 3.72)**	-
Immunosupr. therapy	-	1,66 (0.99-2.18)
Revision prosthesis	1.37 (0.96 – 1.90)	1.47 (0.99-2.18)
Chronic inf (>3 m)	**2.20 (1.51 – 3.20)**	**1.69 (1.10-2.60)**
Bacteremia	**1.69 (1.19 – 2.40)**	-
Symptoms dur. (x day)	-	**1.00 (1.00-1.00)**
Exchange remov. Comp	**0.60 (0.44 – 0.81)**	**0.65 (0.50-0.93)**
Need for ≥2 debrid.	1.38 (0.96 – 1-99)	**1.68 (1.10-2.57)**
Rifampin (per day)	-	**0.98 (0.96-0.998)**
Glyicopeptides (per day)	-	**1.04 (1.02-1.06)**
Co-trimoxazole (per day)	-	**1.04 (1.002-1.08)**

	Early failure (n=444, 55 fails)	Late failure (n=389; 71 fails)	Fail After (n=318, 61 fals)
Sex (female)	-	**0.51 (0.30-0.85)**	
Age (per year)	**1.04 (1.00-1.07)**		
Rheumatoid arthritis	**3.33 (1.40-7.93)**		
Immunosuppressive ther.	-	**2.64 (1.46-4.79)**	
Revision prosthesis	-	**1.77 (1.07-2.93)**	
Chronic infection (>3 mo)	**1.41 (1.10-1.81)**		**2.24 (1.24-4.05)**
Bacteremia	**2.23 (1.80-4.20)**		
S. Pyogenes	**3.31 (1.41-7.77)**		
Symptoms duration > 7d	-	**1.70 (1.05-2.75)**	
Polyethylene Exchange	-		**0.44 (0.26-0.76)**
≥2 desbridements	-	**2.45 (1.45-4.15)**	
B-lactams (no Rifa)		-	**0.48 (0.28-0.84)**
B-lactams (plus Rifa)		-	**0.34 (0.12-0.96)**
Quinolones (plus Rifa)		0.21 (0.03-1.54)	-
Glycopeptides (no Rifa)		**2.82 (1.43-5.53)**	-

Streptococcal PJI managed by DAIR

Patients not failing during treatment
(n=318, 61 filures)



Group of treatment	Failures/n (%)
βL + Rifa during> 21 days	6/60 (10%)
βL >21 days without Rifa (≤21 days)	26/154 (17%)
Rifa >21 days without βL (≤ 21 days)	10/48 (21%)
≤21 days βL & ≤ 21 days Rifa	19/56 (34%)

Final thoughts

- Multicenter study are needed
  - so we may produce statistically robust studies
  - so the sample keeps homogeneity

- Re. Staphylococcal PJI managed by DAIR
  - the success rate is ~ 55%
  - treatment with rifampin ameliorates the prognosis, including MRSA
  - MRSA infection does not necessarily carry a worse prognosis
  - treatment in the first days must focus planctonic bacteria
  - 8 weeks of treatment may be enough as long as things go well

Final thoughts

- Re. Streptococcal PJI managed by DAIR
  - the success rate is ~ 60%
  - no big differences are seen between streptococcal species
  - the mainstay of treatment are beta-lactams
  - addition of rifampin may ameliorate the prognosis

- Re. management with DAIR
  - Zimmerli's / IDSA criteria must be followed
  - the sooner the patient is operated the better, but no specific time limits have been found
  - post-operative PJI with prosthesis age <3 months are probably suitable for DAIR
  - the exchange of removable increases the odds of success

MERCI BEAUCOUP DE VOTRE ATTENTION
